Project Title: Global Impact of Ukraine Russia War (2014 -2022) Analysis

1. Introduction

This project analyzes the global economic impact of the Russia-Ukraine War by examining key sectors such as oil, agriculture, commodities, and inflation from 2014 to 2022. Using real-world datasets and data visualization techniques, the study aims to identify trends and understand how disruptions in one region can create ripple effects across the global economy.

2.Objective

To study and visualize the economic impact of war using real-world datasets.

3. Data Sources

Datasets were collected from public sources including World Bank, commodity datasets, and inflation datasets.

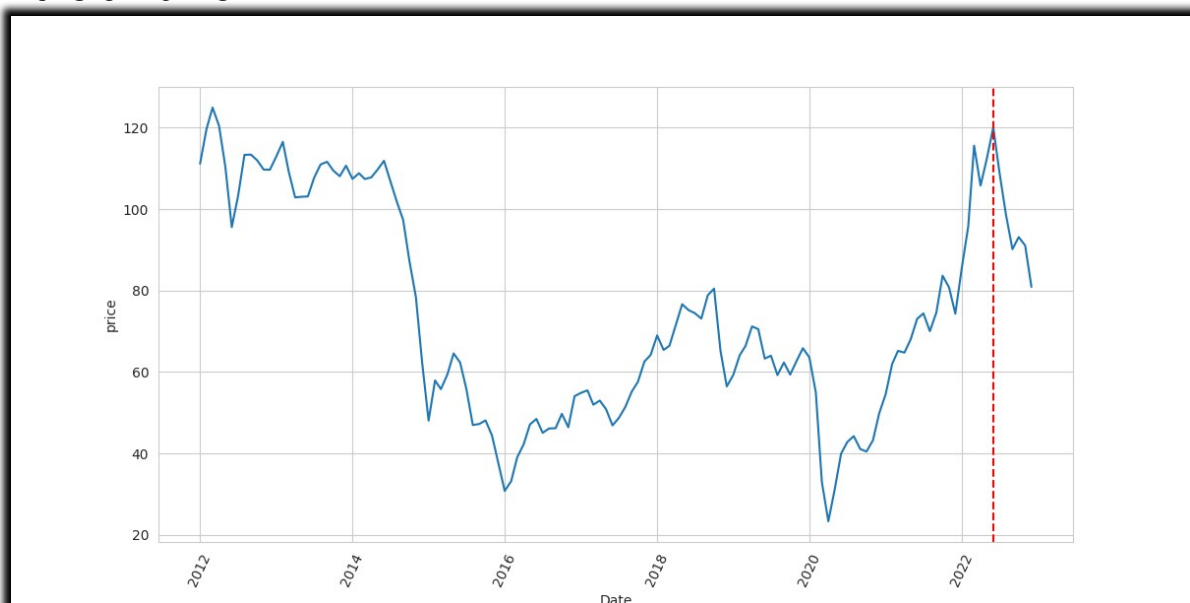

4. Methodology

Data cleaning, filtering, and transformation were performed using Python libraries like Pandas and NumPy.

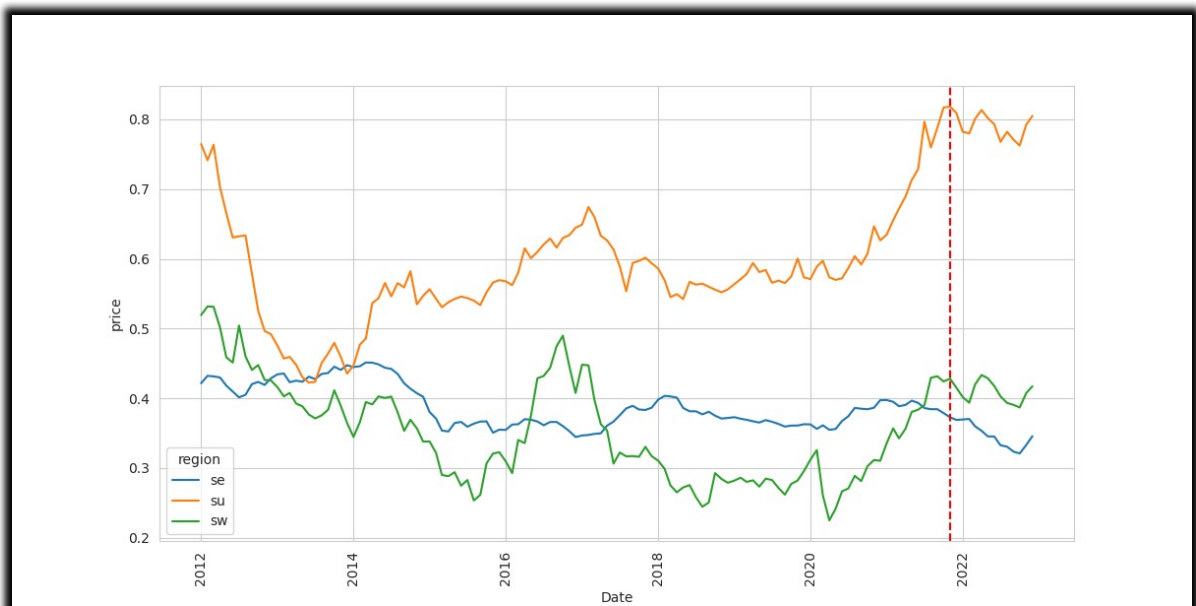

Visualization was done using Matplotlib and Seaborn.

5. Analysis

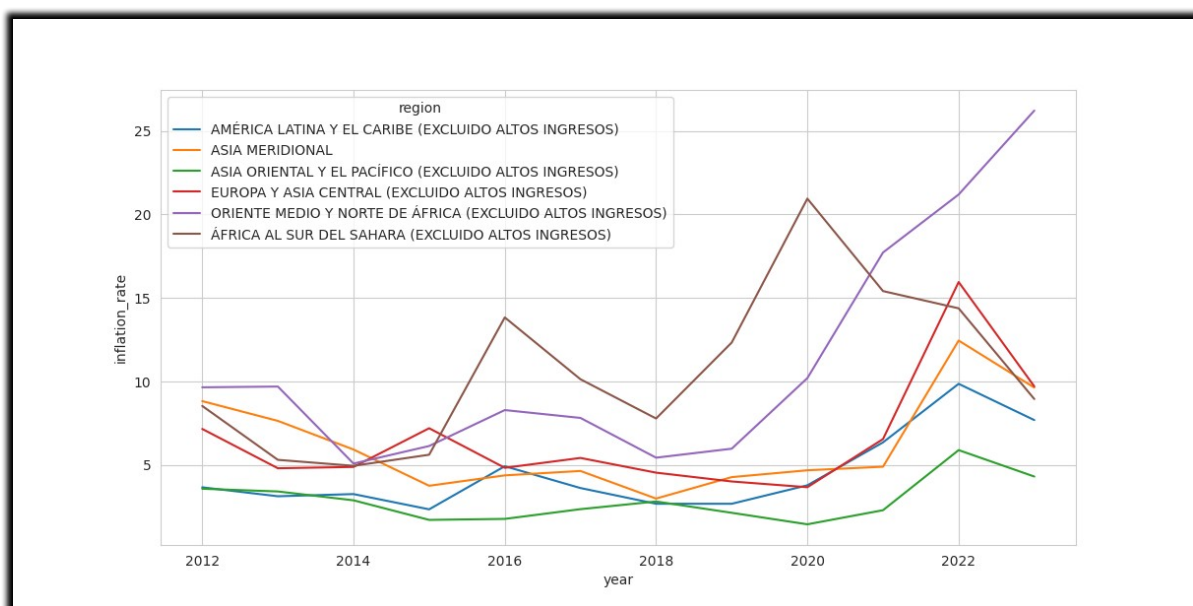

1.Oil Prices were high during the peak war at 2022 .Also can see a growth in price after 2014 for while beacuse of russian invasion in the ukraine

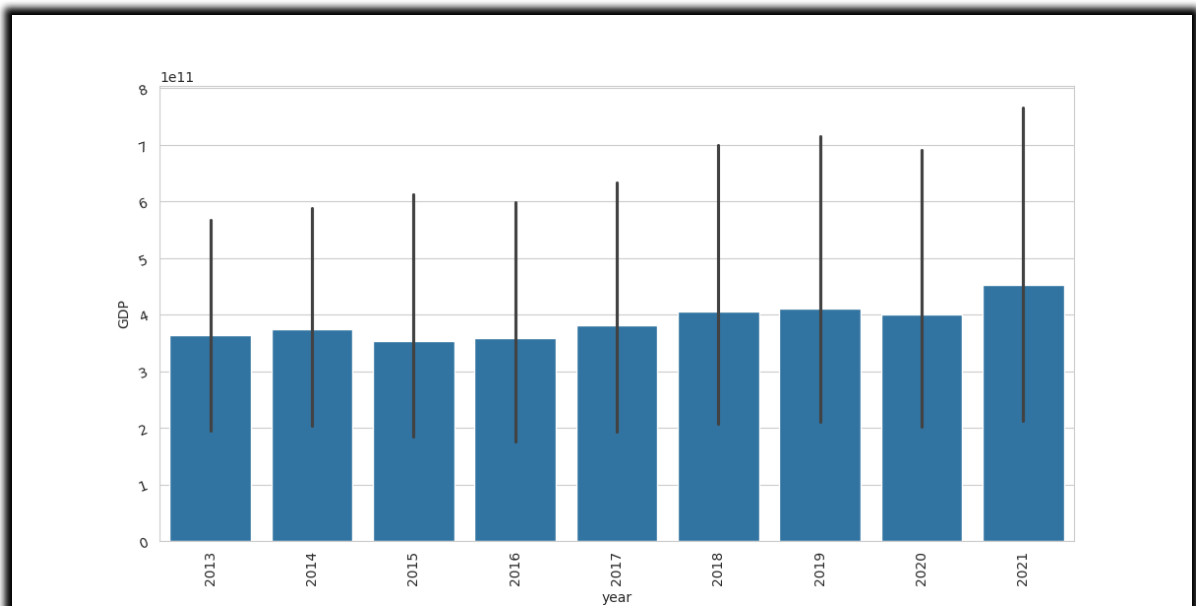

2.Sugar Prices increased severely in Europe and moderatly in all over world.

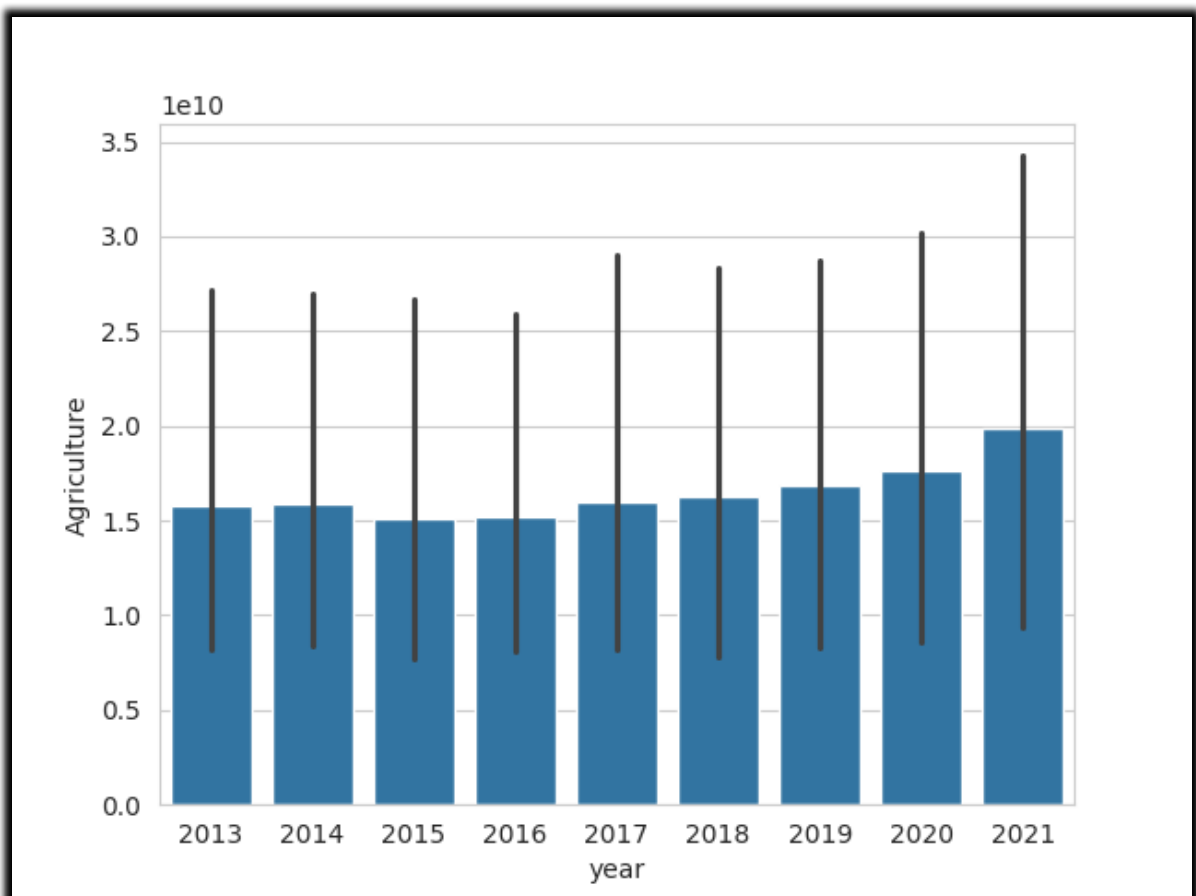

3.We can conclude that european countries are badly affected but this war showing thier inflation rate increment . No affect on African or Pacific Countries

4. We can see the slight decrement on Global GDP growth after 2014. Shows The Ukraine – Russia war affect the GDP globally.

5. This Barplot shows decrement of Agriculture Growth after 2014.

Conclusion – We analyse and represent the Impact of Russia – Ukraine War on Global GDP , Commodities etc. We can conclude such kind of war should be avoided and keep in the mind its effect of it on global scale.
